Reviews

This published book is wonderful. It is really simplified but unexpected situations within the fifty percent of the ebook. Once you begin to read the book, it is extremely difficult to leave it before concluding.

(Dr. Janis Reilly)

ARCTIC SEA ICE VARIABILITY AND TRENDS, 1979-2006

BiblioGov. Paperback. Book Condition: New. This item is printed on demand. Paperback. 34 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. Analysis of Arctic sea ice extents derived from satellite passive-microwave data for the 28 years, 1979-2006 yields an overall negative trend of $-45,100 - 4,600 \text{ km}^2\text{yr}$ ($-3.7 - 0.4$ decade) in the yearly averages, with negative ice-extent trends also occurring for each of the four seasons and each of the 12 months. For the yearly averages the largest decreases occur in the Kara and Barents Seas and the Arctic Ocean, with linear least squares slopes of $-10,600 - 2,800 \text{ km}^2\text{yr}$ ($-7.4 - 2.0$ decade) and $-10,100 - 2,200 \text{ km}^2\text{yr}$ ($-1.5 - 0.3$ decade), respectively, followed by Baffin Bay/Labrador Sea, with a slope of $-8,000 - 2,000 \text{ km}^2\text{yr}$ ($-9.0 - 2.3$ decade), the Greenland Sea, with a slope of $-7,000 - 1,400 \text{ km}^2\text{yr}$ ($-9.3 - 1.9$ decade), and Hudson Bay, with a slope of $-4,500 - 900 \text{ km}^2\text{yr}$ ($-5.3 - 1.1$ decade). These are all statistically significant decreases at a 99 confidence level. The Seas of Okhotsk and Japan also have a statistically significant ice decrease, although at a 95 confidence level, and the three remaining regions, the Bering Sea, Canadian Archipelago, and Gulf of St. Lawrence, have negative slopes that are not statistically significant. The 28-year trends in ice areas for the Northern Hemisphere total are also statistically significant and negative in each season, each month, and for the yearly averages. This item ships from La Vergne, TN. Paperback.
